

Quiz (06/01)

1. **(35 points)** A drug manufacturer claims that a certain drug cures a blood disease, on the average, 70% of the time. To check the claim, government testers use the drug on a sample of 100 individuals and decide to accept the claim if 60 or more are cured. Suppose that the cure probability is 0.5. Let X be the number of people cured.
 - (a) Find the probability distribution of X ;
 - (b) Find the mean and variance of X ;
 - (c) Use the normal curve table to find the probability that the claim will not be rejected.
2. **(15 points)** Suppose that a system contains a certain type of component whose time in years to failure is given by T . The random variable T is modeled by the exponential distribution with mean time to failure $\beta = 2$. If n of these components are installed in different systems, what is the probability that at least one is still functioning at the end of 6 years?
3. **(15 points)** The average life of a certain type of motor is 6 years with a standard deviation of 1 years. The manufacturer replaces free all motors that fail while under guarantee. If the manufacturer is willing to replace only 1.5% of the motors that fail, how long a guarantee should he offer? Assume that the lifetime of a motor follows a normal distribution.
4. **(35 points)** Suppose that an average of 3 customers per hour arrive at a shop in accordance with a Poisson process.
 - (a) What is the probability that the shopkeeper will wait more than one hour before the first customer arrives?
 - (b) What is the probability that the shopkeeper will wait less than one hour before the sixth customer arrives?
 - (c) What is the average waiting time before the sixth customer arrives?

Probability Distributions:

Gamma $f(x) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-x/\beta}$; $\Gamma(\alpha) = \int_0^\infty x^{\alpha-1} e^{-x} dx$

Exponential $f(t) = (1/\beta) e^{-t/\beta}$

Normal $f(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-(1/2)[(x-\mu)/\sigma]^2}$

Poisson $f(x) = e^{-\mu} (\mu)^x / x!$

Table A.23 The Incomplete Gamma Function: $F(x; \alpha) = \int_0^x \frac{1}{\Gamma(\alpha)} y^{\alpha-1} e^{-y} dy$
